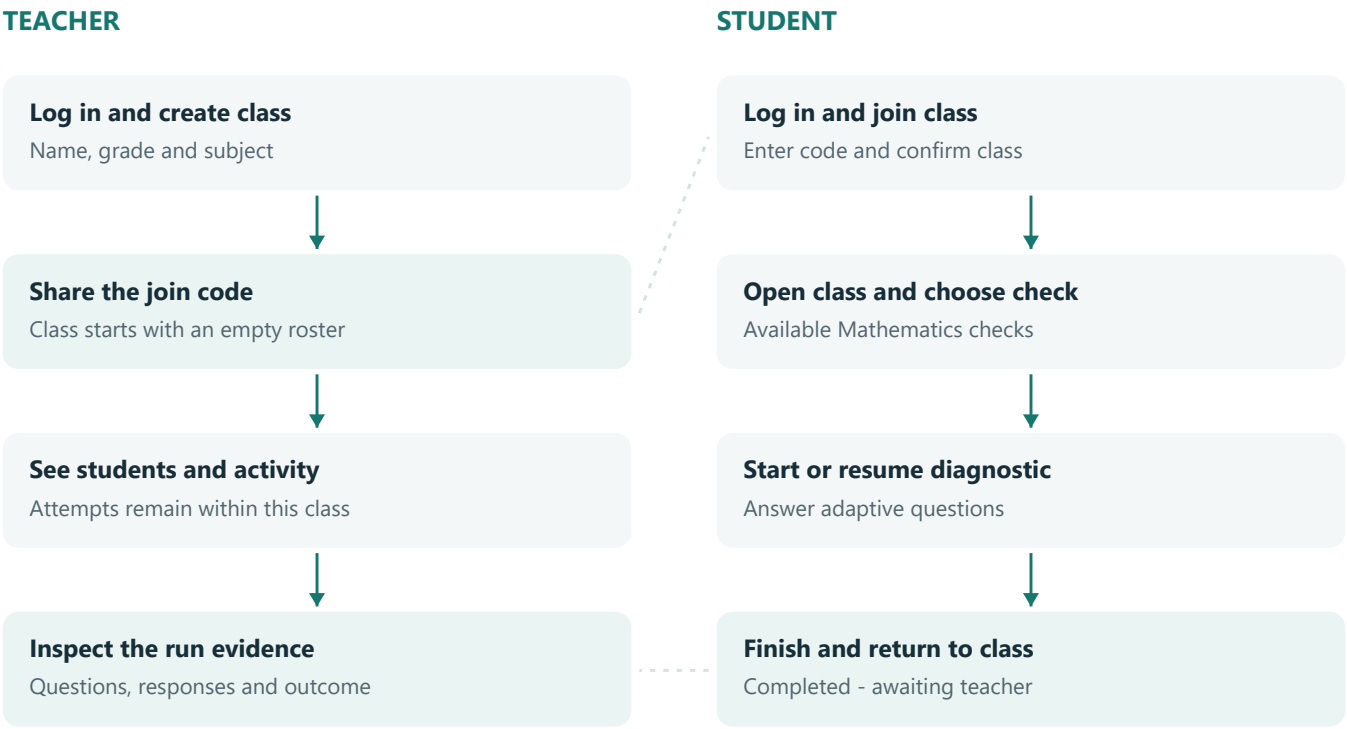
PROPOSED PLAN / FOR DISCUSSION

A class as the shared workspace

A Google Classroom-inspired journey for teacher setup, student enrollment and class-based diagnostic checks.

The teacher creates a class, students join once using a code, and diagnostic activity happens inside that class. Membership gives the student a stable place to return to and gives assigned teachers the correct roster and run evidence.



Starting assumptions

Student self-start: students choose from available reviewed checks in a joined class. Teachers inspect the resulting activity. Teacher-assigned checks remain a separate design choice.

Prototype scope: Mathematics, synthetic demo accounts, class creation, code joining, roster visibility and class-linked diagnostics. Announcements, messaging and teacher approval actions arrive later.

Status: a logical proposal, not an implementation or a completed acceptance record. Amend the product decisions before handing this plan to a coding agent.

01 / PROPOSED USER JOURNEY

The teacher journey

1. Log in and open My classes

Show the teacher their assigned class cards and a prominent **Create class** action. Each card identifies the class, grade, subject and student count. The initial empty state explains how to create the first class.

2. Create a class

Ask for a class name, grade, subject and optional description. Example: **Grade 8A - Mathematics**. Default the prototype to Grade 8 and Mathematics. The creator becomes an assigned teacher automatically; the teacher does not perform a separate membership step.

3. Land in the class and share its code

Open the newly created class immediately. Show **No students yet**, the join code, and **Copy code**. The teacher shares the code through an existing communication channel. Student joining needs no email invitation or manual approval under this proposal.

Class workspace

Area	Teacher content	Student content
Overview	Class details, student count and recent diagnostic activity.	Class details, teacher information and own recent activity.
Diagnostics	Available checks and student attempts, with links to evidence.	Available checks and own attempts, with Start or Resume.
People	Assigned teachers and the full student roster.	Teacher information initially; peer visibility is a later decision.

4. Watch the roster and inspect activity

A joined student appears even before starting a check. After a check starts, the teacher sees its state and latest activity under that student in the correct class. Opening an attempt shows its questions, responses, engine outcome and evidence trail.

Keep the engine result and human review state separate

A finished run may contain a supported engine conclusion or a refusal such as insufficient evidence. Display the actual outcome to the assigned teacher. A finished run is not automatically a teacher-approved result; approval and student feedback release belong to the later review workflow.

02 / PROPOSED USER JOURNEY

The student journey

1. Log in and open My classes

Show joined class cards and a **Join class** action. A returning student opens the existing class directly. Joining is a one-time membership action; the code is not required each time they return.

2. Enter a code and confirm the class

The student enters the teacher's code. Show the class name and teacher before final confirmation so the student can catch a wrong code. Choosing **Join** adds the membership immediately and opens the class. If already enrolled, open the existing class without adding another membership.

3. Choose an available diagnostic check

The class overview offers **Start a diagnostic**; the Diagnostics area lists available reviewed Mathematics checks. Use readable titles such as **Rounding**. Internal unit IDs remain behind the interface. Only checks compatible with the class subject are available.

4. Start or resume

Before starting, show the selected class, check title and a short purpose statement: Answer questions so your teacher can understand where you need support. Explain that assigned teachers can see the responses. If an unfinished attempt exists for the same check in this class, offer **Resume** rather than silently creating a duplicate.

5. Answer adaptive questions

Present one question at a time and let the engine choose the follow-up or stop. Keep the selected class attached throughout. The student never needs to select a teacher or class again during the attempt. Returning after an interruption should preserve accepted answers and resume the saved attempt.

6. Finish and return to the class

When the engine finishes, show **Check completed - awaiting your teacher** and a clear return-to-class action. Keep unfinished attempts visibly unfinished. In the initial prototype, do not release unreviewed misconception labels or probabilities to the student.

Attempt states visible to the student

State	Next action
Not started	Start the selected available check.
In progress	Resume the saved attempt in this class.
Completed	See completion status; await teacher feedback.
Abandoned	Show that the attempt ended early. New-attempt policy remains to be defined.

03 / PROPOSED USER JOURNEY

Rules and implementation handoff

Behavior that should stay predictable

Situation	Proposed behavior
Invalid or archived-class code	Explain that the code cannot be used. Do not create a membership.
Student already joined	Open the existing class; do not duplicate enrollment.
Student belongs to several classes	Keep each attempt attached to the class in which it started.
Unrelated class or attempt	Reject access. Teachers see assigned classes; students see their own memberships and attempts.
Older completed attempts	Keep history. Show the latest attempt with its date without overwriting previous evidence.
Request or connection failure	Show a clear retry or return action. Do not pretend joining or answer submission succeeded.

Decisions to settle before implementation

Who initiates checks? This proposal defaults to student self-start. A teacher-assigned alternative is: teacher publishes a check, selected students see it in class, students complete it, and the teacher inspects the results. That needs explicit rules for recipients, deadlines and repeat attempts.

Class structure and attempts: this sketch uses a subject-specific class such as Grade 8A - Mathematics. Confirm whether a class should offer several subjects, when completed checks can be retaken, how early exits behave, and whether students can see classmates.

What a coding agent would receive

Turn the agreed journey into action contracts with actor, inputs, outputs, data source and success/failure checks. Adapt the existing class screens; persist class membership and enforce server-side identity and access. Hand the selected enrollment and diagnostic unit to the run-start interface. Coordinate roster and run-summary data with Ashher's dashboard work; Harris reviews Ahmed's class flow.

The current schema maps this flow to **classroom**, **class_teacher**, **class_subject** and **enrolment**. A diagnostic session references one enrollment, which fixes its student and class. These are implementation anchors; the product decisions above remain editable.
